

This document maps the critical review findings to the Revision 2 updates.

| Review Issue                                          | Revision 2 Response                                                                                                                      |
|-------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| Registration interface missing                        | Added a dedicated registration contract with a concrete Phase 1 interface and message flow.                                              |
| State observation strategy underdefined               | Added task-type-specific observation model and explicit observed/inferred/unsupported boundaries.                                        |
| Missing notification fields                           | Expanded the task schema with lastNotificationSentAt, lastNotificationStatus, lastObservedAt, lastObservedStatus, and observationSource. |
| JSON registry concurrency risk                        | Replaced JSON registry recommendation with SQLite-backed registry for Phase 1 and documented why.                                        |
| NFR-5 overhead conflict                               | Made Phase 1 explicitly deterministic and non-LLM for routine watchdog behavior.                                                         |
| Notification emitter unspecified                      | Added a concrete emitter contract and OpenClaw integration approach for notification delivery.                                           |
| Unknown-state boundary undefined                      | Added explicit state definitions and transition criteria, including unknown/stale boundaries.                                            |
| No risk register                                      | Added a risk register section in the Software Program Plan.                                                                              |
| Registry location may conflict with memory management | Moved operational state out of memory/ and into a dedicated state path using SQLite.                                                     |
| FR-7 ID missing                                       | Corrected requirements numbering and requirement IDs.                                                                                    |

V&V missing  
negative/stress  
testing

Expanded V&V with negative, stress, restart,  
contention, and degraded-observability scenarios.
